Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-7, embracing a method of employing an unspecified agent including any immunomodulatory nucleic acid molecule to modulate cell death in a eukaryotic cell, classifiable in class 514, subclass 44.
- II. Claims 8-12, drawn to an assay for identifying an agent that effect an increased binding activity between any immunomodulatory nucleic acid to DNA-PK, which also embraces a protein binding assay, classifiable in class 435, subclass 7.1.
- III. Claim 13, drawn to a product by process, which is unspecified in its structure, embracing any polypeptide, classifiable in Class 530, subclass 350.

The inventions are distinct, each from the other because of the following reasons:

Groups II and III are related as product and processes of making. The inventions can be shown to be distinct if either or both of the following can be shown: (1) the process for making the product as claimed can be practiced with another materially different product or (2) the product as claimed can be made in a materially different process of making that product (MPEP § 806.05(h)). In this instant, the agent as claimed in Group III is not required to have any specific structure, and could be any agent including those that were made and/or isolated by other recombinant biological techniques. The process as claimed in Group II may embrace an agonist of DNA-PK, whereas Group III may embrace a transcription factor that increases the activity of DNA-PK. Groups I and III are also unrelated because the agent is unspecifically claimed and is not related to the method of Group I claims.

In addition, method of Group I and method of Group II are distinct because the agent of Group I is limited to applications of modulation of cell death in a eukaryotic cell *in vitro* and therapeutically *in vivo*, whereas the method of Group II has nothing to do with goals and effects

as set forth in Group I claims, but rather for an intended application of identifying an agent that effect increased binding activity between any immunomodulatory nucleic acid to DNA-PK, wherein a protein assay may be embraced. The invention of Group I and Group II, each comprises materially distinct steps and are directed to distinct goals and effects.

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art because of their divergent subject matter, fall into different statutory classes of invention, and are separately classified and searched, and because it would be unduly burdensome for the examiner to search and consider patentability of all of the presently pending claims, restriction for examination purposes as indicated is proper.

Applicant is advised that the response to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed.

Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 C.F.R. § 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a diligently-filed petition under 37 C.F.R. § 1.48(b) and by the fee required under 37 C.F.R. § 1.17(h).
